"DDT is good for me-e-e!"

The great expectations held for DDT have been realized. During 1946, exhaustive scientific tests have shown that, when properly used, DDT kills a host of destructive insect pests, and is a benefactor of all humanity.

Pennsalt produces DDT and its products in all standard forms and is now one of the country's largest producers of this amazing insecticide. Today, everyone can enjoy added comfort, health and safety through the insect-killing powers of Pennsalt DDT products . . . and DDT is only one of Pennsalt's many chemical products which benefit industry, farm and home.

GOOD FOR STEERS—Beef grows meatier nowadays . . . for it's a scientific fact that—compared to untreated cattle—beefsteers gain up to 50 pounds extra when protected from horn flies and many other pests with DDT insecticides.

KNOX FOR THE HOME—helps **Knox-Out** to make healthier, more comfortable homes . . . protects your family from dangerous insect pests. Use Knox-Out DDT Powders and Sprays as directed . . . then watch the bugs "bite the dust"!

GOOD FOR FRUITS—Bigger apples, juicier fruits that are free from unsightly worms . . . all benefits resulting from DDT dusts and sprays.

GOOD FOR DAIRIES—Up to 20% more milk . . . more butter . . . more cheese . . . tests prove greater milk production when dairy cows are protected from the annoyance of many insects with DDT insecticides like Knox-Out Stock and Barn Spray.

GOOD FOR ROW CROPS—25 more barrels of potatoes per acre . . . actual DDT tests have shown crop increases like that! DDT dusts and sprays help truck farmers pass these gains along to you.

KNOX FOR INDUSTRY—Food processing plants, laundries, dry cleaning plants, hotels . . . dozens of industries gain effective bug control, more pleasant work conditions with Pennsalt DDT products.

In 1947, 2 Sanitarians from the United States Public Health Service investigating *Anopheline* behavior wrote:

“the habits of the mosquitoes in question are of prime importance in determining the likelihood of their being exposed to DDT deposits for a sufficient time to produce death”

Anopheles, CDC

The **time** mosquitoes spend **resting**, accounts for a **large portion** of their **daily time-activity budget**

Anopheles gambiae, CDC

Aedes aegypti, CDC

For an indoor dwelling species like *Aedes aegypti*, resting is a key determinant of physiology and survival

3-D Representation of the Instances When Mosquitoes are Resting Indoors

(using an experimental house as architectural model)

Aedes aegypti, CDC

Ajayi et al., 2021

♀ Resting Behaviors

- 1 Exoskeleton Hardening
- 2 Predator Avoidance
- 3 Waiting for Host
- 4 Blood Digestion/Oogenesis
- 5 Sleep/Neurological Recovery

Non-Resting Behaviors

- Blood-feeding
- Oviposition

Jimenez-Vallejo et al., 2025

Aedes aegypti demonstrate a pronounced
**preference to rest at heights closer to the
ground**

Dzul-Manzanilla et al., 2016

Aedes aegypti demonstrate a pronounced preference to rest at heights closer to the ground

Jimenez-Vallejo et al., in prep

Selectively spraying insecticides according to the behavior of *Aedes aegypti* can improve efficacy and reduce costs

Insecticide Residual Spraying has evolved to be “**TARGETED**”; aka TIRS

Fig. 1. Distribution of paired *Ae. aegypti* abundances inside houses stratified by collection height. Each symbol indicates an abundance occurrence (e.g., the point at $x = 12, y = 0$ shows a house that had 12 *Ae. aegypti* below 1.5 m and none above 1.5 m). The size of the spheres is proportional to the number of houses with a given *Ae. aegypti* abundance above and below 1.5 m (e.g., the largest sphere indicates that 205 houses had the values [1,0], whereas the smallest spheres represent a single house). The dashed line indicates the point of indifference, where abundance is the same above and below 1.5 m.

Dzul-Manzanilla et al., 2016

Fig. 1 Targeted indoor residual spraying (TIRS) to control *Ae. aegypti*. In urban environments, houses are primarily built of brick and cement, and *Ae. aegypti* rests preferentially below 1.5 m of height. Spraying residual insecticides in walls below 1.5 m and in key resting sites such as under furniture (#1 in figure, represented in green) will eventually kill *Ae. aegypti* that may be emerging from immature larval habitats outdoors (2) and rest indoors on treated surfaces (3). After exposure to the residual insecticide, mortality can occur immediately (4) or after several hours/days (5)

Manrique-Saide et al., 2020

Similar entomological impact (~70% reduction in adult abundance) using a **fraction of application time** (<18%) and **insecticide volume** (<30%)

A two-arm, parallel, unblinded, cluster randomized controlled trial in Yucatan quantified the efficacy of TIRS to reduce disease burden

TIRS trial Design Merida, Mexico

50 Clusters located in
DENV transmission
hot-spot area:

25 **TIRS**
25 **Control**
(regular MOH vector control
actions will not be stopped)

5x5 city-block clusters

Pediatric cohort
(2-15 at
enrollment):
Total sample
size, N= 4,600
Number per
cluster, n=92

25 random “yolks” across Merida
received annual TIRS spraying once
every **THREE** years

Manrique-Saide et al., 2020

Like other **mechanisms of resistance**, **behavioral adaptations** against **insecticides** can **decrease efficacy** of interventions

Hubbard and Murillo., 2024

Like other **mechanisms of resistance**, **behavioral adaptations** against **insecticides** can **decrease efficacy** of interventions

Hubbard and Murillo., 2024

Behavioral Resistance:

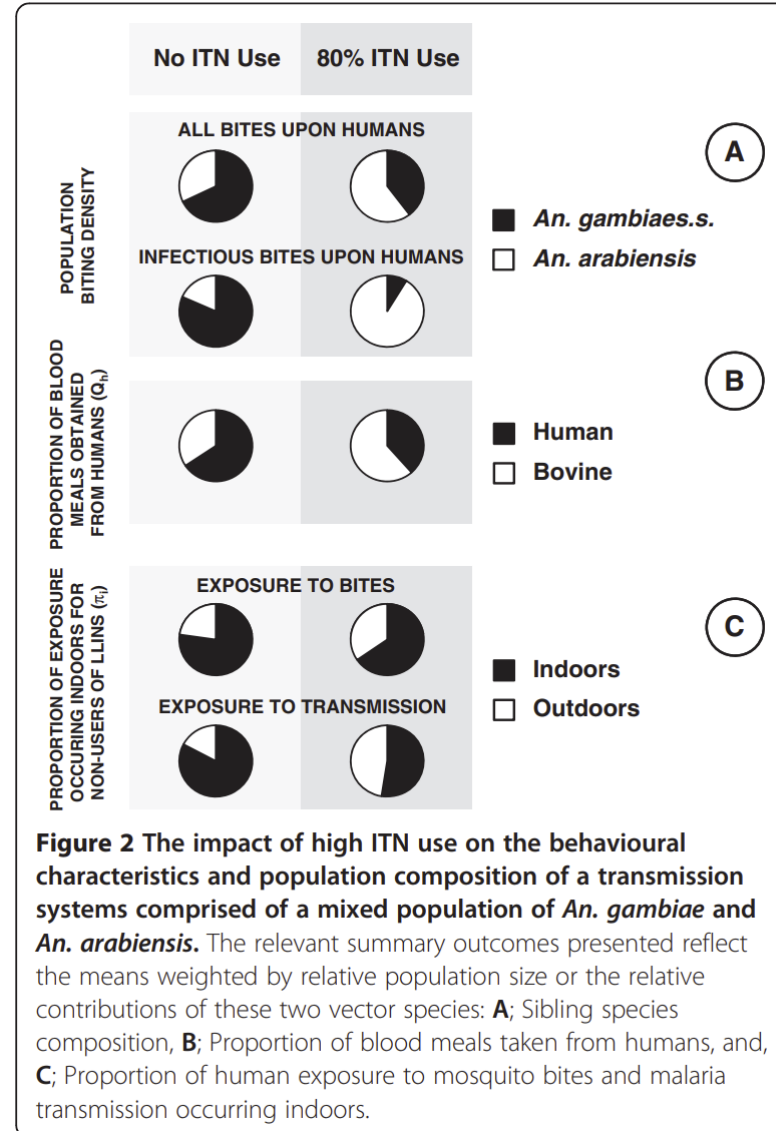

“those **actions**, evolved in **response** to the selective pressure exerted by a **toxicant**, that **enhance** the **ability** of a population to **avoid** the **lethal effects** of that toxicant”

Like other mechanisms of resistance, behavioral adaptations against insecticides can decrease efficacy of interventions

Hubbard and Murillo., 2024

Behavioral Resistance:
 “those actions, evolved in response to the selective pressure exerted by a toxicant, that enhance the ability of a population to avoid the lethal effects of that toxicant”

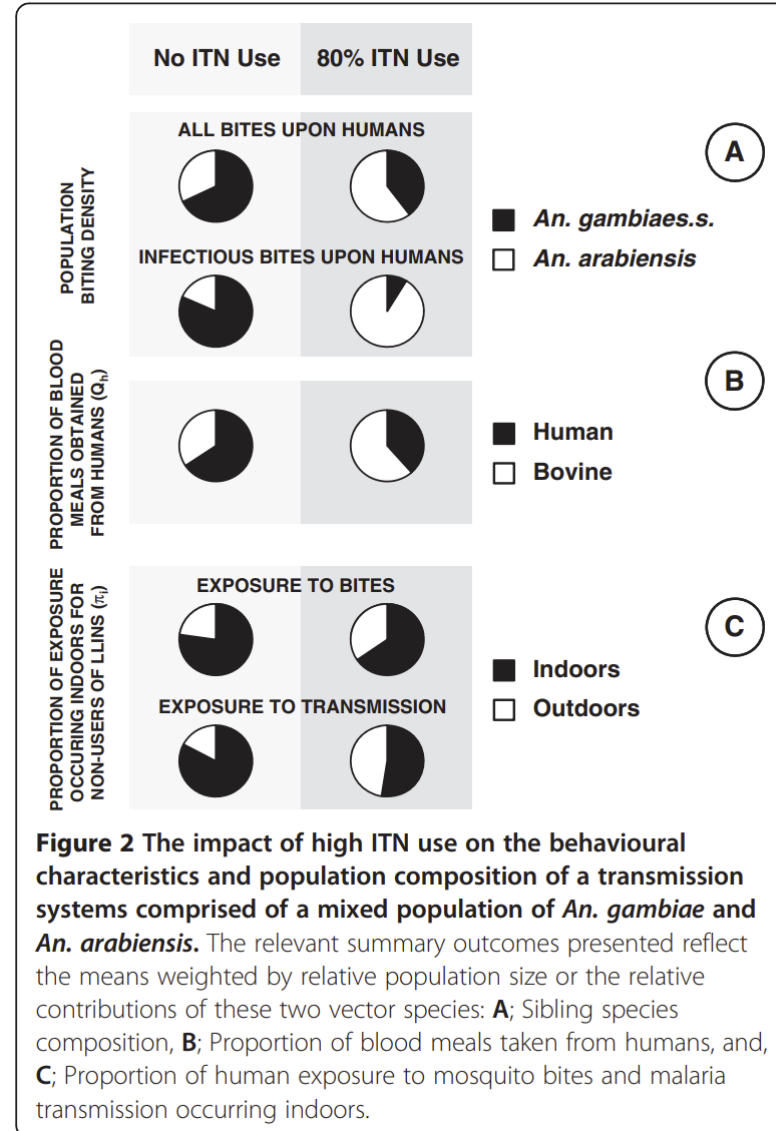

Govella et al., 2013

Like other mechanisms of resistance, behavioral adaptations against insecticides can decrease efficacy of interventions

Hubbard and Murillo., 2024

Behavioral Resistance:
 “those actions, evolved in response to the selective pressure exerted by a toxicant, that enhance the ability of a population to avoid the lethal effects of that toxicant”

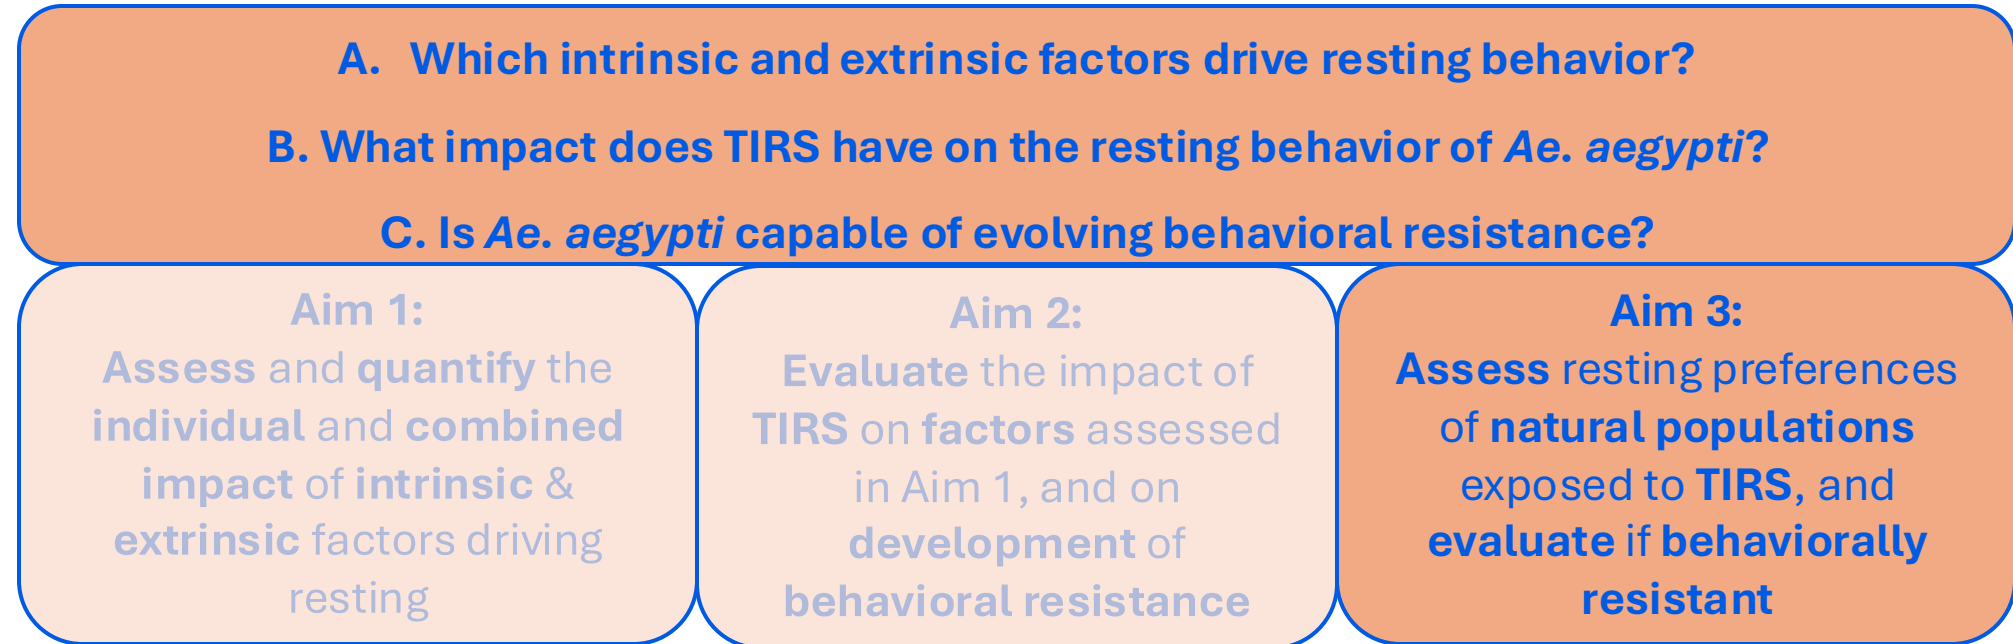

The **targeted focus** of TIRS shifts the **selective force** experienced by mosquitoes in **3D space**

- A **fraction** of mosquitoes are still choosing to **rest > 1.5m**
 - **Escape mortality**
 - Across scales component
 - **Selection** can **favor** this **fraction** (if resting behavioral traits are heritable)
 - Behavioral resistance evolves
 - TIRS is **jeopardized**

My **dissertation** looks to deeply **characterize** the factors driving **resting** and **assess** evolution of **behavioral resistance**

• **Hypothesis**

- After **3 years** of **exposure**, if *Aedes aegypti* can develop **behavioral resistance** to **TIRS**, then a **higher number** of mosquitoes would be **collected resting** at heights **above 1.5 meters** in **TIRS-treated** households **vs Control** households

Stratified collections (above vs below) were done 2mo, 4mo, and 6mo after third round of TIRS spraying in 2023

TIRS trial Design Merida, Mexico

50 Clusters located in
**DENV transmission
hot-spot area:**

25 **TIRS**
25 **Control**
(regular MOH vector control
actions will not be stopped)

Manrique-Saide et al., 2020

(C)

Vazquez-Prokopec et al., 2009

For each collection:

- A random sample of 10% of the houses (~1350) located in the “yolk” of each cluster (treatment vs control)
- Collections took 10 minutes using Prokopack aspirators
 - Stratified by height: one tech collects above 1.5m and the other below 1.5m

After three years of exposure to TIRS, the proportion of mosquitoes collected below stays close to ~65% for both TIRS and Control arms

On a **cluster scale**, we **observe no significant difference** in the **number of mosquitoes collected above 1.5m** **between arms** across time

On a **house scale**, we observe **higher abundance of low resting** mosquitoes **both** in the **TIRS** arm and the **Control** arm

Averaging at a house-scale, a higher number of mosquitoes is collected below in Control houses across time

The same is **observed in TIRS-treated houses**, with a **sustained reduction in the number collected at either height across time**

Across **all** post-intervention **periods** in **2023**, there is **no evidence** that **TIRS** treatment **altered** the **number** of mosquitoes **resting above 1.5m** compared to **Control** houses

GLMM: Count ~ Arm * Height + (1 | House_ID)

Conclusions

Conclusions

Conclusions

Across three years of continuous exposure, *Aedes aegypti* did not shift resting preferences

- Not enough time?
- Not enough heritability in resting behavior traits?
- Shifting from indoor to outdoor?
- Other resistance mechanisms favored

Conclusions

Across three years of continuous exposure, *Aedes aegypti* did not shift resting preferences
